SOURCE: Vynalezky, no. 7, 1966, 22

TOPIC TAGS: rocket engine, solid propellant rocket engine, Solid Rocket Propellant System

ABSTRACT: The proposed solid-propellant rocket motor with a layered laminated casing consists of a central cylindrical section and two closing sections. The motor is distinguished by the conical shape of the closing sections and by their attachment to the cylindrical central section of the rocket motor by their larger base; the upper closing section is solid, and a nozzle is located in the lower closing section. [WA No. 88].

B

TITLE: Czechoslovakia's metallurgy in the 20th jubilee year since liberation

SOURCE: Hutnicke listy, no. 5, 1965, 305-309

TOPIC TAGS: metal industry, steel industry, industrial production, rolling mill, metallurgic furnace, metallurgic research facility

ABSTRACT: The Czech metallurgical industry has grown substantially in the last 20 years, according to Josef Krejci, Minister of the Metallurgical Industry and Ore Mines. Although 90% of the iron ore used had to be imported from the USSR (Krivoy Rog), the production of raw iron reached 5,716,000 tons in 1964 as compared to 1,675,000 in 1937 (the year of highest prewar production). Since 1945, eight new blast furnaces with an average capacity of 995 m³ and one with a capacity of 1719 m³ have been put into operation.

Card 1/3

L 3046-66

ACCESSION NR: AP5017202

3

The 1964 steel production reached 8,377,000 tons, compared to 2,291,000 tons in 1937. The largest portion, 83%, was melted in open-hearth furnaces, 14.3% in electric furnaces, and 2.7% in Thomas convertors. The corresponding figures for 1937 were 83.8, 6.2, and 10%. Presently there are 74 open-hearth furnaces in operation: 44 of them have a capacity of less than 100 t, 18 between 100 and 200 t, and 12 over 200 t. The largest have a capacity of 400 t. Over 60% of the total volume of steel was melted with oxygen. The share of alloy steels reached 16.8% in 1964. A number of new alloy steels, among them a special steel for the reactor vessel of a Czech atomic power plant, have been developed.

4

Krejci states that there are now in operation 62 hot rolling mills, 54 cold rolling mills, 13 seamless-tube rolling mills, 17 tube welding mills, and 8 roll bending mills, most of which were built after 1945. (There is however, another article written by Krejci and published in Hutnik, v. 15, no. 5, 1965, 209-212 which gives different, more realistic figures: a total of 76 hot and cold rolling mills without tub rolling mills, 24 of which were built after 1945.) This growth of the

metallurgical industry required a considerable amount of scientific research work. Research is presently concentrated in five state institutes, five independent institutes located at plants, and sixteen plant institutes. Almost 5000 people, including 132 scientists and 2680 graduate engineers and technicians, are working at these institutes. Orig. art. has: 3 tables.

SOURCE: Ceskoslovenska fysiologie, v. 14, no. 4, 1965, 308-309

TOPIC TAGS: rat, hormone, endocrinology, calcium, gland drug, drug effect, pharmacology

ABSTRACT: The effect of oxytocin on isolated breast or lactating rat was directly dependent on the calcium concentration; the effect of 9 oxytocin analogs was weaker but decreased activity was less than decreased uterotonic effect. Some qualitative differences were found, especially with leucyl-cystein-oxytocin, which had some protracted hormonogenic properties. [JPRS]

*K otázkám bronchiálních píštělí. The problem of bronchial fistulas ROZHL. TUBERK. 1956, 16/6 (293-297) Illus. 6

Thorough anatomical and histological observations of 169 bronchial trees showed that the sharply bordered round orifices the size of a pin head, which are frequently observed in bronchoscopy between 2 cartilages, are never symptoms of a recent or old perforation of lymphatic nodes. Black anthracotic pigmentation of the mucosa is always connected with underlying scarified lymphatic nodes, showing most frequently tb processes. Pigmentations which are not so conspicuous and rather greyish in colour are not typical for tb. An increased number of longitudinal folds of the mucosa of the main or lobar bronchi is not per se a direct prove of an inflammatory process.

1751. VIRUS MENINGO-ENCEPHALITIS FROM THE VIEWPOINT OF TOPICAL DIAGNOSIS - Virusové meningoencefalitidy v zrcadle topické diagnostiky - Krejčí J. - ČAS. LEK. ČES. 1957, 96/8 (225-230)

The author had the occasion to be the first to examine in the years 1948-1951 the until then unknown tick-borne virus meningo-encephalitis. He treated on the whole 112 cases of which one died. The clinical manifestations of these cases are analysed in order to determine with the help of topical diagnosis the places where the noxa prevail. Examinations of infected mice have proved that the lesions are not only in the grey but also in the white matter. Not only the meninges were involved, but also the cerebral cortex, the subcortical grey matter the mesencephalus, the medulla oblongata, the cerebellum and the spinal cord especially in the anterior horns. Most frequent was the meningo-encephalitic form, occasionally in about 5% of cases also the myelitic form. A latent developing muscular atrophy is characteristic of these forms of meningo-encephalitis.

1719. **Primitive pulmonary adenocarcinoma (pulmonary adenocarcinoma of alveolar type)** Adénocarcinome pulmonaire primitif (adénocarcinome pulmonaire de type alvéolaire). SIMEČEK C., KREJČI J. and SIMEČKOVÁ B. *Poumon* 1958, 17/4 (351-368); Tables 1; Illus. 12

An analysis is made of 11 cases of primary pulmonary adenocarcinoma. Stress is laid on the prolonged clinical latency, on the diagnostic value of the radiological examinations and especially on that of the cytological studies. Attention is drawn to the close relationship between the development of this adenocarcinoma and the existence of previous, mainly cicatricial pulmonary alterations. From the point of view of the histogenesis, it is considered that there exist all forms of transition between alveolar and bronchiolar adenocarcinoma, and that, contrary to the classical opinions, the point of departure is unicentral. The mucus formation is variable, in accordance with the maturity of the tumour. References 91. Gernez-Rieux - Lille

TITLE: Substructure of persistent slip bands in cyclically deformed copper 27

SOURCE: Physica status solidi, v. 15, no. 1, 1966, 71-82

TOPIC TAGS: deformed copper, polycrystalline copper, dislocation distribution, dislocation density, surface extrusion, slip, slip band

ABSTRACT: The ^{p/}dislocation distribution on the surface layer of cyclically deformed specimens of polycrystalline copper is studied by means of transmission electron microscopy of thin foils, both parallel and nonparallel to the surface. The distribution within the surface layer and near the persistent slip bands is found to differ considerably from that inside the specimens. The persistent slip bands consist of zones of alternately high and low dislocation density. The zones of high density are linked together at a particular depth below the surface. The zones of

L 45421-66

ACC NR: AP6026376

low density are assumed to serve as "channels" in which the motion of dislocations emitted from Frank-Read sources is relatively free. The escape of these dislocations from the free surface results in surface extrusions. Orig. art. has: 10 figures. [Authors' abstract] [KS]

Prague, Ceskoslovenska Fysiologie, Vol 15, No 5, Sep 66, p 390

Abstract: Experiments were conducted on 48 New Hampshire chickens aged up to 28 days. In 1 day old chickens the follicles of Bursa Fabricii were formed by medullar cells of epithelial origin. In 5-9 day old chickens characteristic changes in the follicular medulla occurred. The medullary cells were transformed into cells of the lymphatic series. The weight of the Bursa in 28 day old chickens was 30 times that of 1 day old, while the total body weight increased only 5 times. No references. (III) and II, there is formed 4-nitrostilbene-2,4'-disulfonic acid which was reduced, without isolation, in the reaction mixture with Fe to 4-aminostilbene-2,4'-disulfonic acid. From the latter, after diazotation and coupling with beta-naphthol, was prepared the tetrahydrate of the disodium salt of stilbene-4-azo- β -naphthol-2,4'-disulfonic acid. In addition to the normal products of arylation there are formed on interaction of I or III with II unidentified products of further conversions which have been detected by paper chromatography. A study was made of the effects of temperature, catalysts and substituents in the molecule of the diazonium salt, on the course of its reaction with II. The experiments were carried out in aqueous medium, in the presence of excess CH_3COONa , in sealed apparatus. Yields of individual reactions were evaluated on the basis of the

amount of liberated CO_2 . Experiments were conducted with I, $\text{C}_6\text{H}_5\text{N}_2\text{Cl}$ and hydrochloric diazonium salts prepared from ortho-, meta- and para-isomers of chloraniline, oxalylamino-aniline, aniline sulfonic acid, anisidine, toluidine, nitraniline and aminobenzoic acid. It was found that III is more active than I. Effect of elevated temperature is apparent only in the case of diazonium salts of low reactivity. Among the catalysts that were used (CuO , CuCl_2 and Cu_2Cl_2) the best was found to be CuCl_2 . Yields of the products of reaction of II with p-substituted hydrochloric diazonium salts are the highest and those with the m-derivatives are the lowest. A beneficial effect on the formation of stilbene derivatives, in the case of p-substituted hydrochloric diazonium salts, is produced by electropositive as well as by some electronegative substituents. NO_2^- and the COOH^-

AUTHOR: Krejčí, Luděk, Engineer

TITLE: A method for direct computation of the equilibrium running conditions of a two-shaft gas turbine unit

PERIODICAL: Strojnícky časopis, no.6, 1961, 340-347

TEXT: In the introductory part of the paper, information regarding the running characteristics, which must be available at the outset of a new design of a gas turbine unit, is listed. It also gives the conditions to be fulfilled for its safe running. The method for direct computation of the equilibrium running conditions, advocated by the author, is basically a reverse process of that normally used. The cycle chosen to illustrate the suggested method is a two-shaft gas turbine unit with a heat exchanger, having the normal arrangement, i.e. the high pressure turbine driving the compressor with the low pressure turbine providing the net output. Before describing the new method itself and discussing its advantages, the author sets out the problems involved in such a calculation. The working line is normally obtained from the calculation of equilibrium running
Card 1/5

A method for direct ...

which is determined by a number of requirements: continuity of mass flow, equality of turbine and compressor pressure ratios, matching of compressor power and load requirements by the corresponding turbine outputs, matching of rotational speeds. These conditions themselves depend on the cycle chosen, type of load, etc. The performance of a gas turbine unit is given by a number of variables, interrelation of which is determined by the characteristics of turbines, compressor, combustion chamber, heat exchanger and connecting duct work. The usual calculation of the equilibrium running makes use of one of the iterative methods. The process begins by choosing a working point on the compressor characteristic and by successive approximations all the above conditions of equilibrium running are satisfied. This process is inevitably long and tedious. Simplification could be achieved by reversing the process, i.e. for given equilibrium running conditions the corresponding working points of turbines and compressor can be found. Expressions of compressor power requirement, the h.p. turbine power output as well as other relations determining the continuity of mass flow through the unit and matching of pressure ratios are then given. The author introduces two

Card 2/5

X

Method for direct

31903
2/041/61/370/005/011/002
E016/0035

complex functions, both in terms of the h.p. turbine expansion ratio, which form an important link in his method. If you add up the procedure even further these two functions should be available in a graphical form. With the help of the complex functions and having the compressor and turbine characteristics it is possible to make a quick and direct evaluation of the equilibrium running conditions by the following procedure: a) pressure ratio of h.p. turbine is chosen; b) corresponding mass flow function is obtained from the turbine characteristic; c) use is now made of one of the above-mentioned complex functions to obtain the mass flow function of the output turbine; d) knowing the output turbine mass flow function, the corresponding pressure ratio of this turbine can be found from its characteristic; e) the compressor ratio and the compressor work can now be calculated, assuming a certain efficiency; f) the value of the second complex function for the chosen expansion ratio of h.p. turbine is obtained from the appropriate graph; g) the equation of the second complex function will yield the necessary information to locate the equilibrium running point on the compressor characteristic. If the compressor efficiency

Z/041/61/000/005/001/0 2
E016/E935

found on the compressor characteristic is not the same as that assumed earlier, a different value is assumed and the process repeated. The method advocated in the paper has been used for design calculations as well as for the analysis of characteristics of the built unit. Some of the results and their detailed analysis can be found in a separate paper. The method is part-graphical, part-numerical. However, if the graphs, giving the two complex functions, are available, the number of calculating steps is appreciably reduced. It is claimed that by using this direct method, time required for calculation is cut down to one tenth of that required when using established methods, whilst maintaining the same accuracy of results. TOPIC TAGS: convective heat transfer, gas flow, radiative heat transfer, enthalpy, subsonic flow

^{1,44,65}
ABSTRACT: The study reviews the possibility of a theoretical solution for convective heat exchange between a subsonic gas flow and a wall in the case where the gas is in a state of thermodynamic equilibrium. The mechanism of the phenomenon and the calculation are described. In a practical application, the initial relationships require the knowledge of the dependence of the Stanton number on the ratio of flow core enthalpy to gas enthalpy at the wall. This relation can be determined experimentally, but in this case the radiation component of the total heat flow must be separated. The role of convection, recombination, and radiation in the total energy transfer is illustrated with the example of heat exchange during the flow of air in a cooled tube. In the 4000-

ABSTRACT: A discussion of heat transfer from a dissociated subsonic gas to a wall is given. The requirements, such as the test section and instruments, which the heat source and the experimental assembly itself must meet are described. The most advantageous heat source is a plasmatron; the flow of gas emerging from the plasmatron is free of pulsations, and contamination of this flow with metal vapors from the electrodes is acceptable. In a high-temperature assembly including a plasmatron, the duration of the experiment is limited primarily by the service life of the sensing elements of the measuring instruments. The parameters of the flow can be determined by contactless methods; only the calorimetric probes which measure the enthalpy of the stream and the heat flow to the wall are subjected to the direct action of the flow. An analysis of the temperature distribution

Quality Control of Processes Which are Not Amenable to
Direct Measurement.
- Orig Pub : Chem Prumysl, 7, No 8, 460-463, 1957, (in Czech with sum-
maries in German, English, French, and Russian)
- Abstract : The direct application of standard quality control tech-
niques to the individual steps of complex processes is
not feasible. The authors therefore propose the utili-
zation of factorial design procedures in the control of
such processes. Using the production of polyamide fibers
as an example, the authors have shown that the method
proposed by them requires no lengthy procedures and but
a small number of measurements.

TITLE: Effect of loading conditions on the rate of propagation of elastic deformation in steel

SOURCE: Kovove materialy, no. 1, 1965, 52-59

TOPIC TAGS: elastic deformation, steel, steel deformation, loading condition, modulus of elasticity

ABSTRACT: This is a continuation of an earlier study in which the rate of propagation and the modulus of elasticity were measured in three materials: type CSN 12 010 steel, type CSN 19 824 steel, and type CSN 42 305 copper. The present article describes investigations of the effect of various impact velocities and of the applied energy on the measured velocity of propagation of the disturbance. The measurement result does not show any effect of the incident impulse magnitude and of its incident velocity on the change in the rate of propagation of an elastic deformation in a bar of type CSN 12 020 steel. The result shows that in CSN 12 020 steel at a room temperature of 18°C, and in the impact velocity range 4.5 to 8,200 m.s.⁻¹, and within the energy input range of 0.12 to

Card 1/2

L 46950-65

ACCESSION NR: AP5005407

130 km, the rate of propagation of elastic deformation is constant and equal to 5,336 m.s.⁻¹. The corresponding modulus of elasticity is $2.27 \cdot 10^6$ kp.cm⁻². Capacitance pick-ups with frequency signal modulation were used to make contactless measurements. Orig. art. has: 1 figure, 3 tables, and 9 formulas.

TITLE: Apparatus for the measurements of surfaces by thermal desorption method

SOURCE: Chemicke listy, no. 1, 1966, 93-94

TOPIC TAGS: adsorption, nitrogen, chemical laboratory apparatus

ABSTRACT: The authors describe an apparatus which they designed and offer instructions for its production. It is based on the principle of measuring the amount of nitrogen adsorbed on the surface of an object of an unknown surface area and an object with a known surface area under the same conditions. The nitrogen is introduced as a mixture with hydrogen or helium. Orig. art. has: 2 figures. [JPRS]

"Depressor Activity of the Milk."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 5, Sep 66, pp 353 - 354.

Abstract: Samples of cow and goat milk were investigated; the milk of cows contained 0.0005 - 0.003 int. units of oxytocin per ml, and the goat milk contained 0.005 to 0.008. Alcohol extracts were more potent than acetone extract; it appears, therefore, that their activity is due to other substances than oxytocin. 5 Western, 1 Czech reference. Submitted at 3 Days of Physiology of Domestic Animals, at Libice, 8 Dec 65.
